R&D in Forestry

- To use our R&D resources efficiently we need the prerequisites for a future scenario
- The biobased circular economy, what does that comprise?
- Efficient forestry R&D output depend on many things
 - Should we maximize profitability in value chains on sub-levels?
 - Should we minimize the ecological footprints? To what cost?
 - Who forms the political agenda? Politicians, product developers, forestry owners, wood refiners?

Other areas are doing it

Electric site

Autonomous drive

So why not (yet) in forestry?

- Development cost per vehicle is high
- Lack funding for large endeavours such as automation or semi-automation
- Companies rely on robust and well-recognized technology

Read more: Lideskog et al. (2015) Development of a Research Vehicle Platform to Improve Productivity and Value-extraction in Forestry. Procedia Cirp

Research focus strategy

- Uncertain future scenarios →
 - Focus on stand alone research questions with inherent value
 - Enable modular and flexible solutions

Research in Forestry

Harvesting and forwarding

- Navigation with optimised routes with respect to sustainable aspects, off-board and on-board
- Detect individual trees' biomaterial performance and respective positions
- New system solutions for increased biomass harvest

Example: Route planning for harvesting and forwarding

- "Off-board" optimization with respect to economy and environment
- "On-board" corrections with respect to
 - Soil properties
 - Inclination
 - etc.

Reforestation

Mounding

+

Manual planting

Disc trenching

Reforestation

M-Planter

Bracke Forest P11

Reforestation

- Navigation/route planning for continuous site preparation and planting
- Automation/Semiautomation of site preparation (and planting)
- Minimize soil impact from machine and equipment
- Address other eco-system services during operation
- Log data for future needs

Sensing/Actuation Strategy

What needs to be identified?

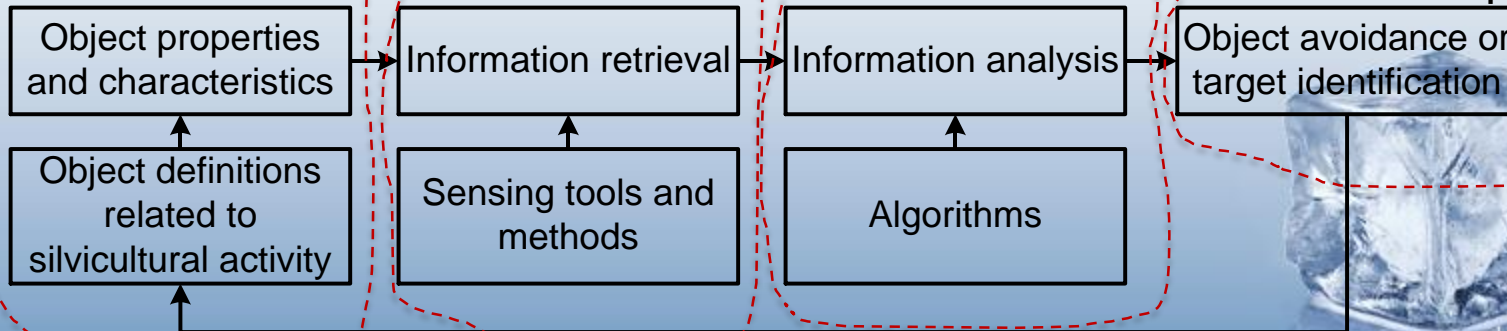

How to gather data for that purpose?

How to interpret that data?

How to control the machine given the interpretation?

Example: Selective mounding

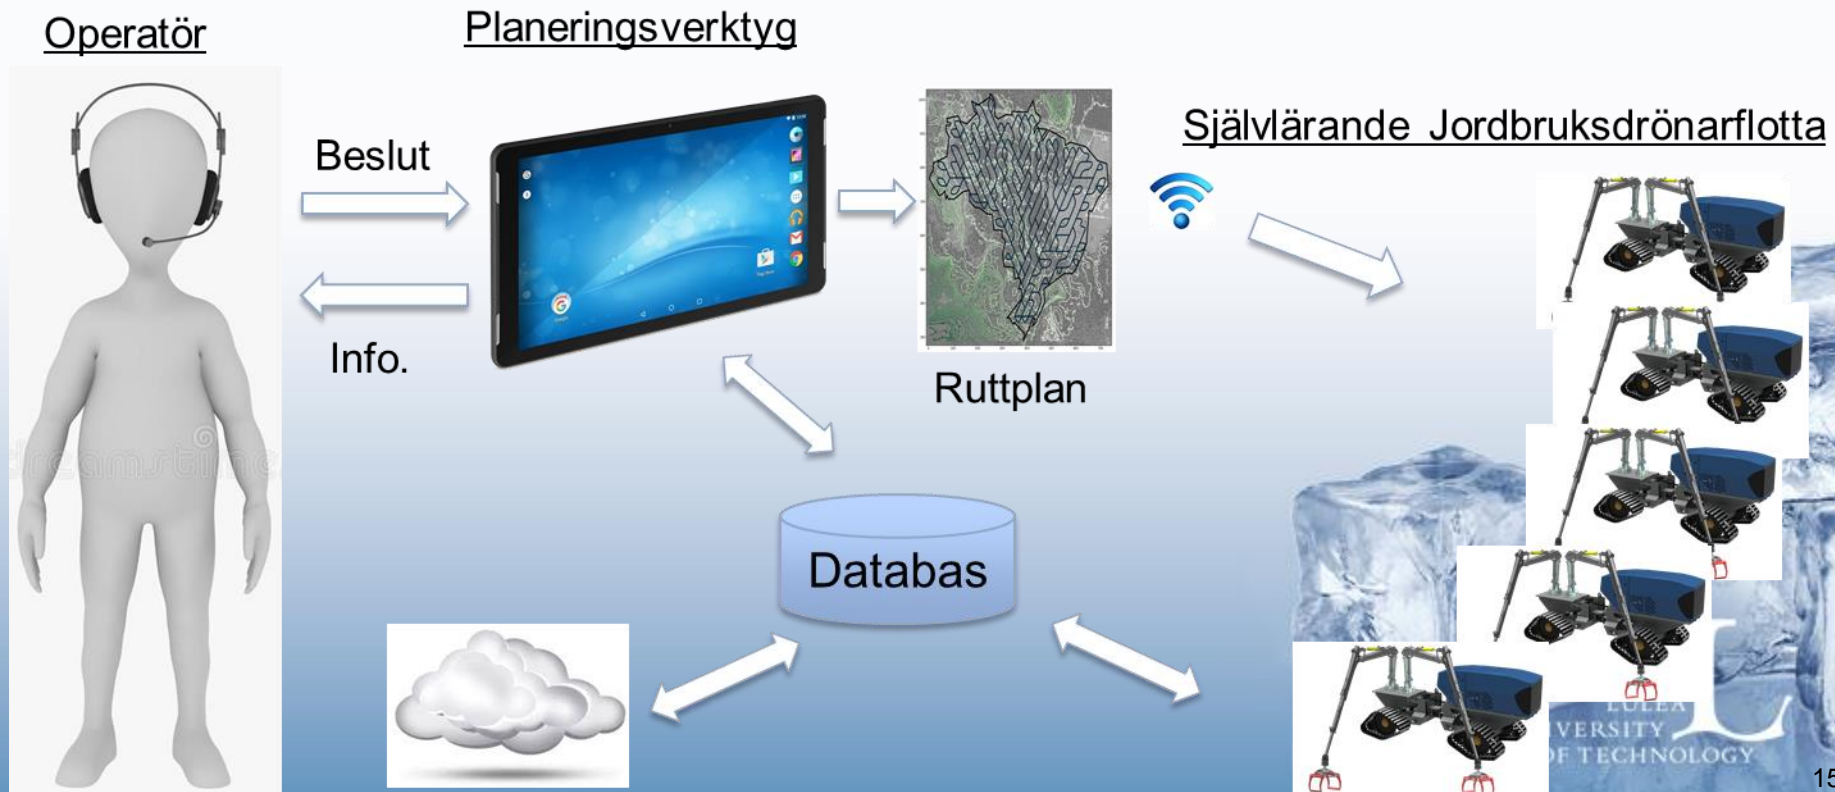

(Cont.) Selective mounding

Example: Autonomous agricultural machine

Development of a self-learning system for autonomous route planning and navigation of agricultural machines

Example: Auto2

- Move the operators from machines to office-like working environments, encompassing:
 - Autodrive – Autonomous drive from A to B
 - Autosafety – Establish safety zone around machine
 - AutoRemote – Teleoperation and feedback to operators

Development platform for autonomous forestry machines

Thanks!
